

Singlepagefolio

Troubleshooting

I worked so hard on **Singlepagefolio**, to deliver the best product as possible, but you know, nobody is perfect.

You can use the Comments on the theme page on the Envato market if you have questions.

I hope you leave a comment also if you are satisfied about the theme.

Here's some useful common problem solving:

- *Some parts are missing and there is some "404 not found" message:*

Maybe you missed some steps in the theme setting up, first try to save again the permalinks (see "**7 Setting up the Readings Homepage & Blog Post & Permalinks**") if it doesn't fix the problem, check **documentation docs from 2 to 7** to figure out what you have missed;

- *Importing the demo data, the standard posts lost the images:*

It could happen, but in this case it's just sample data, so **don't worry**, it is not a real problem;

- *I can't see my site updates:*

Try to **clean the browser cache** first. If it doesn't fix it **maybe you are using the performance plugin**, see the relative doc in the documentation;

- *In multi language mode, when updating/deleting the project carousel images, there are differences as they appear in the languages:*

It could happen, due to the code of the qTranslate-X plugin. **Try to update the images** again in the project. If it doesn't fix it, **copy the project content**, and paste it within a new one. Then move the old one to trash;

How to come back safely from multilang

If you were using the **qTranslate-X** plugin but you want to come back to just one language, here's how to do it in a safely way.

Install this plugin (<https://wordpress.org/plugins/qtranslate-to-wpml-export/>)
qTranslate Cleanup and WPML Import.

Note from the plugin description:

This plugin can either cleanup the qTranslate meta-HTML tags from your site and leave just one 'clean' language, or migrate all languages to WPML's format.

You only choose "leave one clean language", I tried it once and it worked.

But you must first do this action:

Go to Settings - Languages - Import/Export

Check - Convert database back to the legacy "dual language tag" style.

Save Settings

Save all qTranslate settings

Go to the Plugins admin page and de-activate qTranslate

Install & activate QT Importer

Go to Options -> QT Importer, select language to keep and click Start.

Important: First make a backup of your database!

If you don't want to use a plugin and/or just want to change a language consider this:

<http://qtranslate-x.com/support/index.php?topic=74.0>

...Use a search and replace string in the database. For example search [:en] and change it to [:your-country code]

Do this before you activate the new language and after you deactivate the existing language.
