

# Singlepagefolio

## Performance

**Singlepagefolio** recommends **W3 Total Cache** if you want to improve the performance. This plugin improves the speed of the site, caching it as well as minifying the source code.

Follow the next 3 steps to set it up:

- Install the plugin and activate it;
- Go to **Performance** ☐ **General Settings** ☐ **General (panel)** then check **"Toggle all caching types on or off (at once)";**
- Click **Save all settings** button.

For further optimization and to learn more options, read the plugin docs.

**NOTE:** Everytime you change something, it could be necessary to clean up the cache to see the changes.

Here's how to do it:

- Go to **Performance** ☐ **Dashboard** ;
- Click **empty all caches** button.
